

CD4098BMS

CMOS Dual Monostable Multivibrator

FN3332
Rev 0.00
December 1992

Features

- High Voltage Type (20V Rating)
- Retriggerable/Resettable Capability
- Trigger and Reset Propagation Delays Independent of RX, CX
- Triggering from Leading or Trailing Edge
- Q and \bar{Q} Buffered Outputs Available
- Separate Resets
- Wide Range of Output Pulse Widths
- 100% Tested for Quiescent Current at 20V
- 5V, 10V and 15V Parametric Ratings
- Standardized Symmetrical Output Characteristics
- Maximum Input Current of 1 μ A at 18V Over Full Package Temperature Range; 100nA at 18V and +25°C
- Noise Margin (Over Full Package/Temperature Range)
 - 1V at VDD = 5V
 - 2V at VDD = 10V
 - 2.5V at VDD = 15V
- Meets All Requirements of JEDEC Tentative Standard No. 13B, "Standard Specifications for Description of 'B' Series CMOS Devices"

Applications

- Pulse Delay and Timing
- Pulse Shaping

Astable Multivibrator

Pinout

TERMINALS 1, 8, 15 ARE ELECTRICALLY
CONNECTED INTERNALLY

Description

CD4098BMS dual monostable multivibrator provides stable retriggerable/resettable one shot operation for any fixed voltage timing application.

An external resistor (RX) and an external capacitor (CX) control the timing for the circuit. Adjustment of RX and CX provides a wide range of output pulse widths from the Q and \bar{Q} terminals. The time delay from trigger input to output transition (trigger propagation delay) and the time delay from reset input to output transition (reset propagation delay) are independent of RX and CX.

Leading edge triggering (+TR) and trailing edge triggering (-TR) inputs are provided for triggering from either edge of an input pulse. An unused +TR input should be tied to VSS. An unused -TR input should be tied to VDD. A RESET (on low level) is provided for immediate termination of the output pulse or to prevent output pulses when power is turned on. An unused RESET input should be tied to VDD. However, if an entire section of the CD4098BMS is not used, its RESET should be tied to VSS. See Table 9.

In normal operation the circuit triggers (extends the output pulse one period) on the application of each new trigger pulse. For operation in the non-retriggerable mode, \bar{Q} is connected to -TR when leading edge triggering (+TR) is used or Q is connected to +TR when trailing edge triggering (-TR) is used.

The time period (T) for this multivibrator can be approximated by: $TX = \frac{1}{2}RXCX$ for CX $\geq 0.01\mu$ F. Time periods as a function of RX for values of CX and VDD are given in Figure 8. Values of T vary from unit to unit and as a function of voltage, temperature, and RXCX.

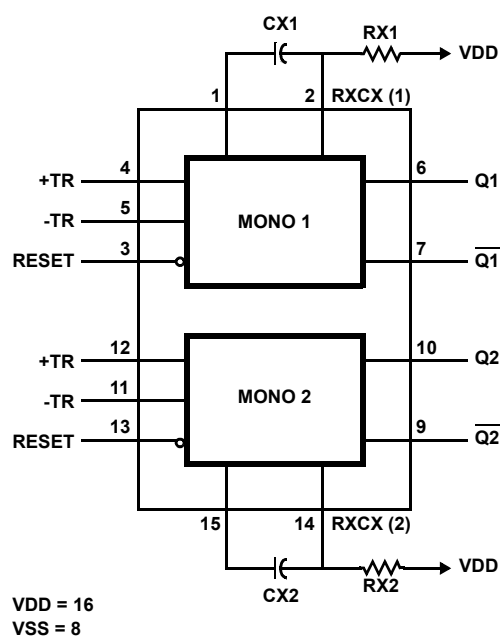

The minimum value of external resistance, RX, is 5k Ω . The maximum value of external capacitance, CX, is 100 μ F. Figure 9 shows time periods as a function of CX for values of RX and VDD.

The output pulse width has variations of $\pm 2.5\%$ typically, over the temperature range of -55°C to +125°C for CX = 1000pF and RX = 100k Ω .

For power supply variations of $\pm 5\%$, the output pulse width has variations of $\pm 0.5\%$ typically, for VDD = 10V and 15V and $\pm 1\%$ typically, for VDD = 5V at CX = 1000pF and RX = 5k Ω .

The CD4098BMS is supplied in these 16-lead outline packages:

Braze Seal DIP	H4T
Frit Seal DIP	H1F
Ceramic Flatpack	H6W

Functional Diagram

Absolute Maximum Ratings

DC Supply Voltage Range, (VDD) -0.5V to +20V
 (Voltage Referenced to VSS Terminals)
 Input Voltage Range, All Inputs -0.5V to VDD +0.5V
 DC Input Current, Any One Input $\pm 10\mu\text{A}$
 Operating Temperature Range -55°C to +125°C
 Package Types D, F, K, H
 Storage Temperature Range (TSTG) -65°C to +150°C
 Lead Temperature (During Soldering) +265°C
 At Distance 1/16 \pm 1/32 Inch (1.59mm \pm 0.79mm) from case for
 10s Maximum

Reliability Information

Thermal Resistance θ_{ja} θ_{jc}
 Ceramic DIP and FRIT Package 80°C/W 20°C/W
 Flatpack Package 70°C/W 20°C/W
 Maximum Package Power Dissipation (PD) at +125°C
 For TA = -55°C to +100°C (Package Type D, F, K) 500mW
 For TA = +100°C to +125°C (Package Type D, F, K) Derate
 Linearity at 12mW/°C to 200mW
 Device Dissipation per Output Transistor 100mW
 For TA = Full Package Temperature Range (All Package Types)
 Junction Temperature +175°C

TABLE 1. DC ELECTRICAL PERFORMANCE CHARACTERISTICS

NOTES:

- A retriggerable one-shot multivibrator has an output pulse width which is extended one full time period (TX) after application of the last trigger pulse. The minimum time between retriggering edges (or trigger and retrigger edges) is 40% of (TX).
- A non-retriggerable one-shot multivibrator has a time period TX referenced from the application of the first trigger pulse.

FIGURE 10. TYPICAL MINIMUM RESET PULSE WIDTH vs EXTERNAL CAPACITANCE

To calculate average power dissipation (P) for less than 100% duty cycle:

P_{100} = average power for 100% duty cycle:

$$P = \left(\frac{t_m}{\tau T} \right) P_{100} \text{ where } t_m = \text{one shot pulse width}$$

τT = trigger pulse period

e.g. For $t_m = 600\mu s$, $t_T = 1000\mu s$, $C_X = 0.01mF$
 $V_{DD} = 5V$

$$P_1 = \left(\frac{600}{1000} \right) 10^3 \mu W = 600\mu W \text{ (see dotted line on graph)}$$
